## **TMDL Summary:**

Lake Elsinore, located in southwest Riverside County, is a natural low point of the San Jacinto River and its drainage basin. The total drainage area of the Lake Elsinore/San Jacinto River watershed is approximately 782 square miles. Because Lake Elsinore is a relatively shallow lake with a large surface area, it has a long history of nutrient enrichment which has led to algae blooms, low dissolved oxygen levels and periodic fish kills.

In 2004, the Santa Ana Regional Water Quality Control Board adopted Nutrient TMDLs for nitrogen and phosphorus. The Nutrient TMDLs include the following components: interim and final response numeric targets for dissolved oxygen and chlorophyll a; causal targets for ammonia, nitrogen and phosphorus; nitrogen and phosphorus wasteload allocations (WLAs) for point source discharges and load allocations (LAs) for nonpoint source discharges (specified as 10-year running averages); and an implementation plan and schedule to achieve reductions in nutrient loads/achieve response numeric targets. Compliance with the numeric targets, TMDLs, WLAs and LAs are to be achieved no later than December 31, 2020.
